Agent-Ready Order Management with MCPs

Your mission: make Order Management **agent-ready** — exposing APIs and data as MCPs that an AI agent can orchestrate in natural language.

Date	Location	Format	Tools
April 9, 2026	Station F, Paris	4-hour hackathon	Anypoint Platform · MuleSoft Vibes · Claude (Code) Maison

The Context

Measuring the European Marketing Campaign — Live.

The **CIO needs immediate visibility** on how our latest campaign is driving sales across our European customer base. Traditional development means long cycles and delayed insights — by the time the dashboard ships, the campaign momentum is gone.

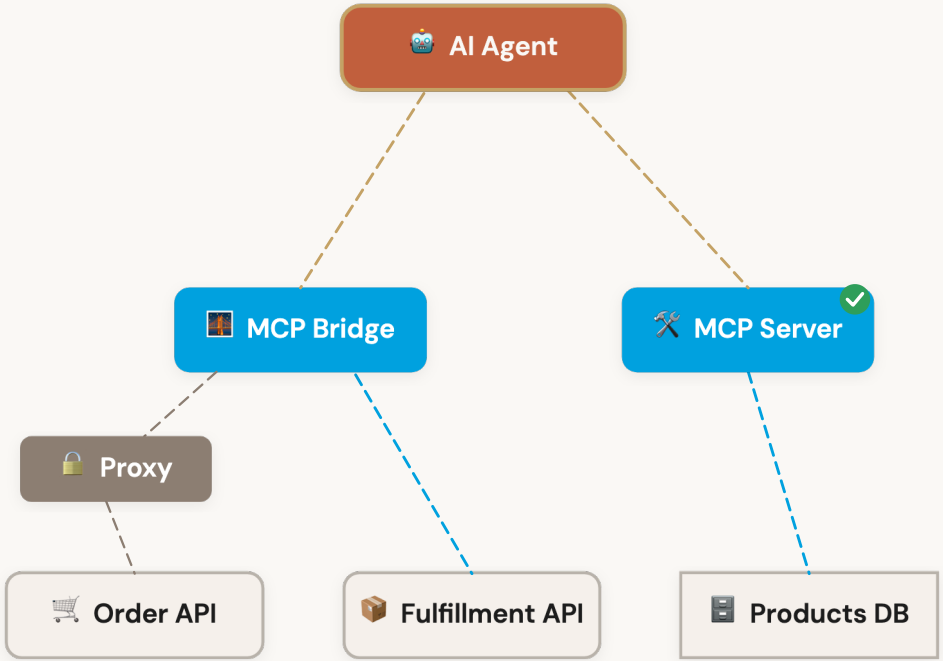
Thanks to **AI**, we **empower the team to access the data and talk to it** — unlocking **live visibility** by conversing naturally with an agent across two APIs and a product database.

SYSTEM	TYPE	ROLE IN THE CAMPAIGN INSIGHT
🛒 **Order API**	🌐 REST API	Surface orders tied to the campaign — customer info, items, timestamps
📦 **Fulfillment API**	🌐 REST API	Map delivery data to isolate our European customer base
🗄️ **Product Catalog**	🛢️ DB	Identify the exact items promoted — name, category, price

Build Plan & Architecture

1. **MCP Bridge**
   Bridge the REST APIs via API Manager
2. **MCP Server**
   Vibe-code a Mule app for the Database
3. **Deploy**
   Ship to Anypoint Platform
4. **Test**
   Agent queries all three systems

A. **Data Masking**
   Apply policies on the Order API



🤖 How AI Helped

- **Code production and deployment** — from a blank editor to a running MCP on Anypoint, with the agent handling scaffolding, connector wiring and packaging end-to-end
- **Planning** — the agent helped us break the challenge into concrete steps, weigh trade-offs and keep the team aligned on the next action
- **Auto-fixing and troubleshooting** — stack traces and config errors were diagnosed and resolved in the loop, without leaving the IDE
- **Presentation creation** — even this deck was largely vibe-coded, turning raw notes into a structured, on-brand story

💡 Key Learnings

- **It works well — but it needs iteration.** First prompts rarely land; refining intent and feeding back context is where the real value comes from
- **Costs are high at the start.** Exploration and trial-and-error burn tokens fast — discipline and good prompting habits pay off quickly

🔄 Impact on Ways of Working

- **No coding skills strictly required to make things happen** — product, data and business folks can now go from idea to working prototype by describing what they want in plain language
- **Expertise is still essential — for verification.** Someone has to read the code, validate the architecture, catch the subtle bugs and own quality. AI doesn't remove the need for senior judgment, it amplifies it
- **Everyone needs a developer mindset** — thinking in terms of inputs, outputs, edge cases and testability becomes a baseline skill, even for non-developers steering the agent

🚀 Next Steps in Your Daily Work

- **Make Claude (Code) Maison your daily driver** — not just for coding, but for writing specs, drafting architecture diagrams, reviewing PRs and documenting decisions. Treat the agent as a pair, not a tool
- **Learn to optimize costs as you learn the craft** — scope prompts tightly, reuse context, pick the right model for the task, and measure what each workflow actually costs so value stays ahead of spend
